Valent Adds Water Source Heat Pump Option to Ventilators

Minneapolis, MN (June 24, 2010) Valent Air Management Systems extends its line of high-percentage outdoor air ventilators with a water source heat pump option. Ranging from 5 to 25 nominal tons, the new refrigeration system dehumidifies high quantities of outdoor air on either boiler/tower or geothermal water loops.

“Water source heat pumps are becoming increasingly prevalent given today’s demand for energy efficiency. This new option allows outdoor air units to be integrated into water loops to further increase system efficiencies,” said Jake Saewert, Valent Sales/Marketing Manager.

As with all Valent products, each water source heat pump ventilator is factory run-tested for 1.5 hours prior to shipment.
