Air-source Heat Pump Option Now Available on Valent Rooftop Units

Minneapolis, MN (December 6, 2011) Valent Air Management Systems has expanded its available air-cooled refrigeration packages to include an air-source heat pump (ASHP) option for effective operation down to 17°F ambient temperatures. Each ASHP unit is equipped with DefrostPLUS, an advanced defrost sequence that monitors ambient temperature and relative humidity to reduce unnecessary defrost cycles.

According to the US Department of Energy, air-source heat pumps are more efficient than traditional heating methods because they *move* energy versus *creating* energy. "These capabilities allow system designers to incorporate air-source heat pump units in colder climates where they were previously unfeasible, said Jake Saewert, Valent Marketing Manager.
